(54) **Cylinder lock and locking disc therefor**

(57) Peripheral notches (7) of locking discs (4) are located so that the locking discs (4) can be disposed in the cylinder lock either way with regard to their median plane, and at least some of the locking discs (4) are formed so that a surface (6a) of the key opening (6) of the locking disc cooperating with the corresponding combination surface of the key is substantially shorter in the axial direction than the overall thickness (A) of the disc and is located asymmetrically with regard to the median plane of the locking disc. Turning of one or more locking discs (4) through 180° around an axis in the plane of said disc changes the location of one or more surfaces (6a) and thus adapts the lock for use with different keys.
